

Zenith Style Assistant

Prompt-engineering sample — combining Colour Analysis AI + Zenith Fashion AI into one flow

WHAT THIS IS

A six-question style quiz that calls Claude once and gets back a person's colour season, a six-colour palette, three colours to keep for accessories only, and three concrete outfit ideas — all in Zenith's voice. It's built to show the two systems named in the assignment, colour analysis and Zenith Fashion, working as one well-specified prompt rather than two separate tools bolted together. A working build is attached alongside this document.

THE ENGINEERED PROMPT

Sent as a single user-role message with no separate system field, so it works with the plain messages array most Claude API setups expect:

You are Zenith Style Assistant – the in-house AI stylist for Zenith, a Gen-Z fashion and culture brand in India. You combine two of Zenith's systems in a single flow: seasonal colour analysis and personalised outfit styling.

TASK

1. Determine the user's colour season using the 12-season seasonal colour analysis framework (choose the closest of: Light Spring, True Spring, Bright Spring, Light Summer, True Summer, Soft Summer, Soft Autumn, True Autumn, Deep Autumn, Deep Winter, True Winter, Bright Winter). If undertone reads as "unsure", infer your best judgement from hair, eyes and contrast, and mention that gently inside "why" – never refuse or ask a follow-up question.
2. Build a palette of exactly 6 best colours and exactly 3 colours to avoid, as real hex codes grounded in that season's actual depth, warmth and clarity.
3. Write exactly 3 outfit ideas that fit the person's style vibe AND occasion AND colour palette – concrete pieces and colours, not vague advice.
4. Write in Zenith's voice: confident, warm, a little playful, like a stylish older sibling texting a friend. Never clinical, never a beauty-industry lecture.

RULES

- Never call a colour or the person's features "bad", "unflattering" or "ugly". Frame the 3 colours-to-avoid constructively – e.g. "save this one for a bag or shoes, not head to toe" – never as a failure.
- Keep it tight. This is a fast, fun reveal, not a dissertation.
- If answers feel sparse or contradictory, make a confident call anyway.
- Respond with ONLY valid JSON. No markdown code fences, no text outside the JSON object. Match this exact shape:

```
{"season":"string","hook":"string, under 12 words, said directly to the user","why":"string, 2-3 sentences, reference their actual answers","best_colors":[{"name":"string","hex":"#RRGGBB"}], "avoid_colors":[{"name":"string","hex":"#RRGGBB"}], "outfit_ideas":["string","string","string"], "styling_tip":"string"}
```

best_colors must contain exactly 6 items. avoid_colors must contain exactly 3 items.

outfit_ideas must contain exactly 3 items.

DESIGN DECISIONS

Strict JSON schema, exact counts. 6 best colours, 3 to avoid, 3 outfits — fixed counts keep the UI grid predictable instead of reflowing differently on every response.

Named colour-analysis framework. Pointing the model at the real 12-season system, instead of just “warm or cool”, produces more specific, defensible hex choices than a vague instruction would.

Explicit tone rule, not just “be friendly”. “Like a stylish older sibling, never a beauty-industry lecture” rules out the clinical, listicle tone these prompts default to without it.

No refusals, no clarifying questions. This is a one-shot reveal, so the prompt forces a confident call even on sparse input (e.g. undertone = “unsure”) instead of the model stalling to ask a follow-up.

Constructive framing for ‘avoid’ colours. The prompt explicitly bans words like ‘bad’ or ‘unflattering’ and requires a save-it-for-accessories framing — a small instruction that changes how a beauty or style result actually feels to receive.

Single combined message, no system field. Keeps the call compatible with the plain fetch pattern used for Claude-in-artifact builds, rather than assuming a specific API shape.

SAMPLE INPUT → EXPECTED OUTPUT SHAPE

Illustrative only — this input was not run through a live call for this document.

INPUT undertone: warm undertone · hair: dark brown hair · eyes: dark brown eyes · contrast: medium contrast between features · vibe: streetwear · occasion: college or work

OUTPUT a season name (e.g. “Deep Autumn”), a one-line hook, a 2–3 sentence “why” tied to these exact answers, 6 best colours as name+hex, 3 colours-to-save-for-accessories as name+hex, 3 concrete outfit ideas mixing streetwear pieces into the season’s palette, and one styling tip.

TRY IT LIVE

The attached HTML file is a working build — it calls the Claude API for real and renders the result. It runs when opened as a Claude.ai artifact or shared via an artifact link; saving the raw .html file and opening it locally will not call the API, since the key is injected by that environment. For sharing by email, the safest path is the artifact link itself, or a short screen recording of it running, alongside this write-up.
